Questions

Part -1

@the_programming_girl

Q. 1 What type of language is python? Programming or scripting?

→ Python is capable of scripting, but in general purpose programming language.

Q. 2 How is python an interpreted language?

→ An interpreted language is any programming language which is not in machine level code before runtime. Therefore, Python is an interpreted language.

Q. 3 What is pep 8?

→ A name PEP stands for Python Enhancement Proposal. It is a set of rules that specify how to format Python code for maximum readability.

Q. 4 How is memory managed in Python?

→ ① Memory management in python is managed by python private heap space. All python objects and data structures are located in private heap. The programmer does not have access to this private heap. The python interpreter takes care of this instead.

② The allocation of heap space for python objects is done by python's memory manager. The core API gives access to some tools

for the programmer to code.

③ Python also has an inbuilt garbage collector which recycles all the unused memory and so for that it can be made available to the heap space.

Q. 5 What is namespace in Python?

→ It namespace is naming system used to make sure that names are unique to avoid naming conflicts.

Q. 6 What are python modules? Name some commonly used built-in modules in python?

→ Python modules are files containing Python code. This code can be functions classes or variables. A python module is a .py file containing executable code.

Some of the commonly used built-in modules are

• os

• sys

• datetime

@the-programming-girl

• json.

Q. 7 What are local and global variable in python?

→ Global Variables:-

Variables declared outside a function or in global space are called global variables.

These variables can be accessed by any

function in the program. @the-programming-guru

Local Variables:-

Any variable declared inside a function is known as a local variable. This variable is present in the local and not in the global space.

Q.8 Is python case sensitive?

→ Yes. Python is a case sensitive language

Q.9 What is type conversion in Python?

→ Type conversion refers to the conversion of one data type into another.

for ex. int(), float(), set(), list()

Q.10 Is indentation required in python?

→ Indentation is necessary for python. It specifies a block of code. All code within loops classes function etc within an indented blocks. It is usually done using four space character. If your code is not indented necessarily. It will not execute accurately and will throw errors as well.

Q.11 What are functions in python?

→ A function is a block of code which is executed only when it is called. To define a python function, the def keyword is used

```
def Newfunc():
    Print("Hi ")
```

Q.12 What is init ?

→ init is a method or constructor in python. This method is automatically called to allocate memory when a new object of a class is created. All classes have the -init- method for eg:

Class Emp :

```
def __init__(self, name):
```

```
    self.name = name
```

```
E1 = Emp("XYZ")
```

```
print(E1.name)
```

@the-programming-girl

Q.13 What is lambda function ?

→ An anonymous function is known as a lambda function. This function can have any number of parameters but have just one statement example :-

```
a = lambda x,y : x+y
```

```
print(a(5,6))
```

Q.14 What is self in python ?

→ Self is an instance or an object of a class.

In python, this is explicitly included as the first parameter. This is not the case in java where it's optional. It helps to differentiate between the methods and attributes of a class with local variables.

The self variable in the init method refers to the newly created object

while in other methods, it refers to the object whose method was called.

Q.15 What are python iterators?

→ Iterators are objects which can be traversed through or iterated upon.
